16. Abstract (Limit: 200 words):

Contains records of approximately 23,000 chemicals which since 1970 have been mentioned in a significant way in journals indexed in MEDLINE, the National Library of Medicine's online bibliographic database. Originally housed in a manual card file, these records were incorporated as a subset of the MEDLARS MeSH (Medical Subject Heading) file, and became searchable online in June 1980. The present list does not include any of the chemical descriptors that are to be found in the D category of MeSH.

The publication is intended to assist indexers, and the users of Index Medicus and MEDLINE. For the indexer, it provides more specific entries than those available in the printed MeSH. It permits users of Index Medicus to locate the chemical subject headings under which citations referring to a more specific chemical can be found.

Introduction

This publication contains records of approximately 23,000 chemicals which since 1970, have been mentioned in a significant way in journals indexed in MEDLINE. Originally housed in a manual card file, these records were incorporated as a subset of the MEDLARS MeSH file, and became searchable online in June 1980. The present list does not include any of the chemical descriptors that are to be found in the D category of Medical Subject Headings (MeSH).

The publication is intended to assist indexers and the users of Index Medicus and MEDLINE. For the Indexer, it provides more specific entries than those available in the printed MeSH. It permits the user of Index Medicus to locate the chemical subject heading under which citations referring to a more specific chemical can be found. As shown in the example below citations concerning "dimethyldodecylbenzylammonium" will be found in Index Medicus under the heading BENZALKONIUM COMPOUNDS. Whether a citation discussing the above compound will also be indexed under ANTISEPTICS or DISINFECTANTS will depend on the scope and emphasis of the article.

The MEDLINE user may search for citations that refer specifically to dimethyldodecylbenzylammonium by including DIMETHYLDODECYLBENZYLAMMONIUM (NM), or a synonym, in a search statement. For a full discussion of the online use of the Chemical Dictionary file, one may consult Section 6 of the NLM Online Services Reference Manual.

In order to limit the size of this publication, the records of chemicals that were cited only three times and have an entry date before 1975, records that were cited only twice and have an entry date before 1982 and records which were cited only once and have an entry date before 1983 have not been included. The list reflects the status of the online Chemical Dictionary as of October 9, 1985, but newly mentioned chemicals are being added to the online Chemical Dictionary throughout the year at the rate of approximately 300 per month. For these reasons, the online file contains numerous entries that are not included here.

The records in this listing are in alphabetical order, following as closely as possible the alphabetization used in MeSH. However, because it was not practical to follow the special MeSH sort procedure, the alphabetization is not identical, e.g., single letters are ignored for alphabetization purposes.

Synonyms (SY) are printed under the Name of Substance (NM), and appear also in alphabetical order in the list as cross-references to the Name of Substance. They are analogous to the "see" reference (entry terms) in MeSH.

Format

The following example illustrates the format of entries in this publication:

NM - dimethyldodecylbenzylammonium
RN - 10328-35-5
RR - 57213-60-2 (maleate[2:1])
RR - 7281-04-1 (bromide)
RR - 139-07- (chloride)
RR - 71288-45-4 (nitrate)
SY - benzododecinium
SY - Sterinol
SY - benzyldodecyldimethylammonium chloride
SY - dodecyldimethylbenzylammonium chloride
SY - Ajatin
HM - *BENZALKONIUM COMPOUNDS
PA - ANTISEPTICS
II - DISINFECTANTS
NO - RN given refers to parent cpd

Of all the fields displayed here, only the main entry (NM), which is in bold-face type in the publication, and the Heading Mapped to (HM) fields are present for every entry; the remaining fields may be present or absent depending on the availability of specific information.

(1) Name of Substance (NM)

This is the main entry for the chemical compound and appears in bold-face type. Wherever possible, the generic name of the chemical as given in United States Adopted Names (USAN), Merch Index, or International Nonproprietary Names (INN) is used. For enzymes, the name adopted by the Commission on Biological Nomenclature of the International Union of Pure and Applied Chemistry and published in Enzyme Nomenclature, is used.

(2) Chemical Abstracts Service Registry Number (RN)

This field contains either the Registry Number or the Enzyme Commission (EC) Number for a given chemical. The field will not appear in the printed record if these numbers are not yet assigned or available.

(3) Related Registry Numbers (RR)

This field identifies Chemical Abstract Registry Numbers for salts and/or stereoisomers of the Name of Substance and their relationship to the "parent" as well as the Chemical Abstract Registry Numbers for enzymes.

(4) Synonyms (SY)

The SY field contains synonyms for a chemical entry which have been identified in indexed MEDLINE journals. These synonyms also are listed alphabetically as "see" references. The user should note that this does not represent a complete list of known synonyms for a chemical, but only those which have appeared in indexed journals.

(5) Heading Mapped To (HM)

This field identifies the MeSH heading under which citations on a given chemical will be located in Index Medicus.

(6) Pharmacological Action (PA)

Pharmacological activities which have been attributed to the chemical term in indexed journals are listed in this field. These activities are displayed as MeSH headings (e.g., TRANQUILIZING AGENTS, ANTINEOPLASTIC AGENTS) or as MeSH heading/subheading combinations (e.g., DOPAMINE/antagonists). Since different articles may discuss different properties of a chemical, not all citations on the chemical will necessarily be found under any given pharmacological action heading in Index Medicus. This field is displayed primarily for informational purposes.

(7) Indexing Instruction (II)

This field contains MeSH headings, alone or in combination with subheadings, which are not pharmacological actions but which are associated with or qualify the term in the NLM field. These may include the identification of the microorganism from which a named toxin is isolated, disease terms with the subheading /drug therapy, hormones associated with the term in the NM field, etc. As with the PA field, not all citations referring to a given chemical will be found in Index Medicus under the subject heading appearing in the Indexing Instruction (II) field for that chemical.

(8) Note (NO)

The purpose of the note field is to provide additional information not given in the SY, PA, and II fields. It may include pharmacologic, biologic, or metabolic activities; synthetic or biosynthetic origins; indication of structure availability; or any other data obtained which are felt to be potentially useful in identifying and characterizing a particular chemical substance.
